Shoot RAW, Drive JPEG: (Two Lines: Merge All, Merge All with Exposure, and Vignette Blends): It's accepted practice now. but they should have pushed more on this three years ago when it became the default. It's much better to shoot RAW than JPG, even if you want to use JPG in your workflow. RAW has far more depth, much better noise reduction (especially in high ISO), and far superior shadow/highlights. Being able to make adjustments like exposure in both RAW and JPG files is key to really pushing the limits of these tradeoffs (shooting RAW): you can make every cent of exposure loss go further in the RAW file. You can also make use of the added noise reduction. Then blending them in order to get a final image something that can be finished. I feel that if you're going to be strict about quality, then RAW is the way to go. Every last cent of brightness and detail, noise, and color depth is your subject. Smart Metadata: I've been trying to get this to work for a very long time. Like the Exposure, LDR, and Gamma controls, it's something left to someone else to implement because it's not a "one click fix," but it's also something that IT's absolutely never mentioned. In the past, there was a script called "Get Smart Metadata" that let you preview your JPG met and pixel mapping data. This is keyword stuff that's available in the Print and Slide show panels. Admittedly, it was also not a "one click fix" type of thing, but at least it was there, and Adobe just removed it.

Additionally, they have the ability to move the shape layer and unite them with the other shapes in an image with simple tools. This attribute of the shape layers to edit shape properly is undetected to many graphic designers using brushes. Photoshop plans to move to a new technology called Perceptual Computing for browsers that use HTML 5. Blur, sharpen, and color-correct tool features are considered (Opens in a new window) under the new technology. With PSD or Photoshop files, or even with a new browser or operating system, the habit that developers have been setting their brushes to 16-bit color will make more sense in the future. Working with locked layers, as well as with hidden and flattened layers, is a great tool for any Photoshop user. Layers are best thought of as a way of grouping together different aspects of a single image. By hiding a layer, you can hide all of its contents from the image editor, or from your layer palette. You can still view and work with that layer's contents, of course, since you still see it in your image window. However, until you click that layer in the Layers palette, it's invisible (Opens in a new window), which can cut down on both the number of layers you need to work with and the size of your file. By showing hidden content, you can create new layers without having to show all of your images in a separate window. Layers Likewise, if you hide a layer and make it visible again, all of the content you'd hidden goes back into view, even if it wasn't visible in the first place. Correcting a red-eye effect in an image may not be the first thing you think of when you consider improving a photo. However, you can correct an image's red-eye using the Clone Stamp Tool. While you can use software to find and correct a red-eye effect, a number of professionals' workstations include the Clone Stamp, because its speed and accuracy is unbeatable. (Opens in a new window) An additional advantage to using the Clone Stamp is its effect on the

background in the image. When you press in the Clone Stamp Tool and pull it back, the background is still affected, because that brush strokes are applied using the background color. When you apply the tool and push it forward again, the Brush Settings insures that the red color caused by the tool remains on top of the skin.

This month's Adobe Photoshop updates include the ability to control and edit the transparency of those objects directly in your Photoshop file. This will allow a user to select an object and save it as a smart object. These objects can then be edited, transformed, wrapped, beveled, filled, have transparency, and saved back to the original Photoshop PSD file. New features that are coming this year for Photoshop include:
