This paper presents the application of inorganic materials in the form of nanoparticles for targeted cancer theranostic agents. Four kinds of biomimetic nanoparticles were prepared based on materials of different composition and shell structure for targeting tumor cells. Tumor cells were firstly taken as the target and used to test the ability of the biomimetic nanoparticles to recognize and target them by phagocytosis. The morphology of the nanoparticles

and the possibility of delivering the drug to target cells were investigated by transmission electron microscopy and fluorescence microscopy, respectively. The effect of drug loading on cell toxicity and stability was also analyzed. The antitumor drug DOX was chosen as a model drug and loaded into the biomimetic nanoparticles, in which the drug release behavior and cell cytotoxicity were also studied. The results of these tests showed that the biomimetic nanoparticles were targeted efficiently, their core-shell structures could be imaged by confocal fluorescence microscopy, the drug DOX could be delivered to tumor cells, and drug release could be adjusted to the desired time. The biomimetic nanoparticles had good targeting and cell toxicity. In summary, the new developed biomimetic nanoparticles have important potential in targeted delivery of antitumor drugs.Q: Recursive String Replace Python I'm trying to create a recursive function to replace some tags with their replacements. I have the following function: def replace(line, to_replace, to_replace2): from urllib.parse import urlparse, unquote return line.replace(to_replace, unquote(to_replace2)) I want to use the function replace within a while loop to do a recursive replacement so that: line = 'this has been replaced with its replacement.' becomes: line = 'this has been replaced with its replacement..' I was going to try to use the loop to replace all the with (and with etc...) and then return the string and do another loop over it to replace the with etc. The issue I'm having is that I f988f36e3a
